## **BICYCLIC COMPOUNDS CAPABLE OF INHIBITING TYROSINE KINASES OF THE EPIDERMAL GROWTH FACTOR RECEPTOR FAMILY**

### **Technical Field**

5           The present invention relates to bicyclic heteroaromatic compounds which inhibit the epidermal growth factor receptor and related receptors and, in particular, their tyrosine kinase enzymic activity.

### **Background Art**

10           Cancer is generally a disease of the intracellular signalling system, or signal transduction mechanism. Cells receive instructions from many extracellular sources, instructing them to either proliferate or not to proliferate. The purpose  
15 of the signal transduction system is to receive these and other signals at the cell surface, get them into the cell, and then pass the signals on to the nucleus, the cytoskeleton, and transport and protein synthesis machinery. The most common cause of cancer is a  
20 series of defects, either in these proteins, when they

-2-

are mutated, or in the regulation of the quantity of the protein in the cell such that it is over or under produced. Most often, there are key lesions in the cell which lead to a constitutive state whereby the cell nucleus receives a signal to proliferate, when this signal is not actually present. This can occur through a variety of mechanisms. Sometimes the cell may start to produce an authentic growth factor for its own receptors when it should not, the so-called autocrine loop mechanism. Mutations to the cell surface receptors, which usually signal into the cell by means of tyrosine kinases, can lead to activation of the kinase in the absence of ligand, and passing of a signal which is not really there. Alternatively, many surface kinases can be overexpressed on the cell surface leading to an inappropriately strong response to a weak signal. There are many levels inside the cell at which mutation or overexpression can lead to the same spurious signal arising in the cell, and there are many other kinds of signalling defect involved in cancer. This invention touches upon cancers which are driven by the three mechanisms just described, and which involve cell surface receptors of the epidermal growth factor receptor tyrosine kinase family (EGFR). This family consists of the EGF receptor (also known as Erb-B1), the Erb-B2 receptor, and its constitutively active oncoprotein mutant Neu, the Erb-B3 receptor and the Erb-B4 receptor. Additionally, other biological processes driven through members of the EGF family of receptors can also be treated by compounds of the invention described below.

-3-

The EGFR has as its two most important ligands Epidermal Growth Factor (EGF) and Transforming Growth Factor alpha (TGFalpha). The receptors appear to have only minor functions in adult humans, but are  
5 apparently implicated in the disease process of a large portion of all cancers, especially colon and breast cancer. The closely related Erb-B2 Erb-B3 and Erb-B4 receptors have a family of Heregulins as their major ligands, and receptor overexpression and  
10 mutation have been unequivocally demonstrated as the major risk factor in poor prognosis breast cancer. Additionally, it has been demonstrated that all four of the members of this family of receptors can form heterodimeric signalling complexes with other members  
15 of the family, and that this can lead to synergistic transforming capacity if more than one member of the family is overexpressed in a malignancy. Overexpression of more than one family member has been shown to be relatively common in human malignancies.

20 The proliferative skin disease psoriasis has no good cure at present. It is often treated by anticancer agents such as methotrexate, which have very serious side effects, and which are not very effective at the toxicity-limited doses which have to  
25 be used. It is believed that TGFalpha is the major growth factor overproduced in psoriasis, since 50% of transgenic mice which overexpress TGF alpha develop psoriasis. This suggests that a good inhibitor of EGFR signalling could be used as an antipsoriatic  
30 agent, preferably, but not necessarily, by topical dosing.

-4-

EGF is a potent mitogen for renal tubule cells. Fourfold increases in both EGF urinary secretion and EGF mRNA have been noted in mice with early stage streptozocin-induced diabetes. In addition increased expression of the EGFR has been noted in patients with proliferative glomerulonephritis (Roychaudhury et al. *Pathology* 1993, 25, 327). The compounds of the current invention should be useful in treating both proliferative glomerulonephritis and diabetes-induced renal disease.

Chronic pancreatitis in patients has been reported to correlate with large increases in expression for both EGFR and TGF alpha. (Korc et al. *Gut* 1994, 35, 1468). In patients showing a more severe form of the disease, typified by an enlargement of the head of the pancreas, there was also shown to be overexpression of the erb-B2 receptor (Friess et al. *Ann. Surg.* 1994, 220, 183). The compounds of the current invention should prove useful in the treatment of pancreatitis.

In the processes of blastocyte maturation, blastocyte implantation into the uterine endometrium, and other periimplantation events, uterine tissues produce EGF and TGF alpha (Taga *Nippon Sanka Fujinka Gakkai Zasshi* 1992, 44, 939), have elevated levels of EGFR (Brown et al. *Endocrinology*, 1989, 124, 2882), and may well be induced to produce heparin-binding EGF by the proximity of the developing, but not arrested, blastocyte (Das et al. *Development* 1994, 120, 1071). In turn the blastocyte has quite a high level of TGF alpha and EGFR expression (Adamson *Mol. Reprod. Dev.*

-5-

1990, 27, 16). Surgical removal of the submandibular glands, the major site of EGF secretion in the body, and treatment with anti-EGFR monoclonal antibodies both greatly reduce fertility in mice (Tsutsumi et al. *J. Endocrinology* 1993, 138, 437), by reducing successful blastocyte implantation. Therefore, compounds of the current invention should prove to have useful contraceptive properties.

PCT patent application Nos. WO92/07844 published May 14, 1992 and WO92/14716 published September 3, 1992 describe 2,4-diaminoquinazoline as potentiators of chemotherapeutic agents in the treatment of cancer.

PCT published application No. WO92/20642 published November 26, 1992 discloses bismono- and bicyclic aryl and heteroaryl compounds which inhibit EGF and/or PDGF receptor tyrosine kinase.

It is an object of the present invention to inhibit the mitogenic effects of epidermal growth factor utilizing an effective amount of bicyclic pyrimidine derivatives, in particular fused heterocyclic pyrimidine derivatives.

It is another object of the present invention to describe bicyclic pyrimidine derivatives, in particular fused heterocyclic pyrimidine derivatives, as inhibitors of the EGF, Erb-B2 and Erb-B4 receptor tyrosine kinases.

It is yet another object of the present invention to describe bicyclic pyrimidine derivatives,

-6-

in particular fused heterocyclic pyrimidine derivatives, that are useful at low dosages as inhibitors of EGF-induced mitogenesis. This therefore leads to a further object of compounds having  
5 extremely low cytotoxicity.

It is a further object of the present invention to describe bicyclic pyrimidine derivatives, in particular fused heterocyclic pyrimidine derivatives, that are useful in suppressing tumors,  
10 especially breast cancers, where mitogenesis is heavily driven by EGFR family members.

It is another object of the present invention to describe bicyclic pyrimidine derivatives, in particular fused heterocyclic pyrimidine  
15 derivatives, that have utility as chronic therapy as inhibitors of EGF-induced responses.

It is another object of the current invention to describe bicyclic pyrimidine derivatives, in particular fused heterocyclic pyrimidine  
20 derivatives, that have utility as therapeutic agents against proliferative overgrowth diseases, including but not limited to, synovial pannus invasion in arthritis, vascular restenosis, psoriasis and angiogenesis. The compounds disclosed herein also are  
25 useful to treat pancreatitis and kidney disease and as a contraceptive agent.

#### Preparative Routes to Compounds of the Invention

##### Scheme 1 - Route for Preferred Groups 1-5, R<sup>4</sup> = H

Displacement of the 2-chloro of 2,6-dichloro-3-nitropyridine is carried out by cuprous cyanide in NMP. Displacement of the second chlorine of this nitrile by fluoride at this step can be advantageous. This is followed by a mild reduction of the nitro group, under conditions where the halogen is not hydrogenolysed. Hydrolysis of the nitrile followed by orthoformate cyclization, and Vilsmeier-type chlorination will give the dihalo-pyridopyrimidine. Displacement of the more reactive 4-chlorine with an appropriate amine is followed by displacement of the 6-halogen with the appropriate nucleophile, ammonia, lower alkylamine, hydrazine, methoxide, to form the final products. (NMP is a solvent, N-methyl-2-pyrrolidone).

2. Another preferred form of the invention has X = NH, n = 0 or 1, in which case R<sup>1</sup> = H, the aromatic ring phenyl optionally substituted, B, D & E carbon, with A nitrogen and R<sup>3</sup> or R<sup>4</sup> H, with the other one amino.

3. Another preferred form of the invention has X = NH, n = 0 or 1, in which case R<sup>1</sup> = H, the aromatic ring phenyl optionally substituted, B, D & E carbon, with A nitrogen and R<sup>3</sup> or R<sup>4</sup> H, with the other one lower mono or dialkylamino.

Reduction of the nitro groups to amines is followed by hydrolysis of the nitrile to an amide. This is cyclized to the pyrimidone with orthoformate, which is converted to the chloride by POCl<sub>3</sub> or possibly turned into the thiomethyl derivative by treatment with phosphorus pentasulfide followed by MeI and a mild base. Displacement with the appropriate amine gives the desired 7-amino compound. The amine functionality can be reductively alkylated or activated by diazotisation of the amino group under acidic or basic conditions, followed by a reduction to the hydrazide, or conversion into a lower alkyl ether, or to a halogen followed by a cuprate or Stille coupling by methods familiar to those skilled in the art. Alternatively, the amine can be reductively aminated, or acylated and reduced to form the alkylamino side chain.

**Scheme 3 -****Route to Preferred Groups 6 and 8-10 where R' = RO**

The known metalation of 2,6-difluoropyridine is exploited twice. LDA treatment followed by a borate/hydrogen peroxide introduces the 3-hydroxy substituent. If the pyridine undergoes the 2nd metalation at the 4 position, the alcohol can be protected as a TIPS (triisopropyl silyl) ether, which will force the second metalation to the 5-position. Alternative nitrations may be used, such as converting the lithium intermediate to a stannane and treatment with tetranitromethane, or the use of NO<sub>2</sub>BF<sub>4</sub> (nitronium tetrafluoroborate). The C<sub>1</sub> displacement may be effected by cuprous cyanide or other sources of cyanide ion. After nitrile hydrolysis and nitro group reduction, ethyl orthoformate may be used instead of

-27-

formamide for the cyclization, and it may be that some cyclizations will require displacement of F by MeS prior to the reaction. The 4-position is activated by chlorination, and the sidechain amine is then introduced. The final displacement can be by alkoxide or amine nucleophiles to generate the various dialkoxy and amino-alkoxy species, and the appropriate use of R can allow the 7-hydroxyl group to be unmasked at the end of the synthesis. (LDA means lithium diisopropyl amide).

6. Another preferred form of the invention has  $X = NH$ ,  $n = 0$  or  $1$ , in which case  $R^1 = H$ , the aromatic ring phenyl optionally substituted, B, D & E carbon, with A nitrogen and  $R^3$  and  $R^4$  lower alkoxy.

8. Another preferred form of the invention has  $X = NH$ ,  $n = 0$  or  $1$ , in which case  $R^1 = H$ , the aromatic ring phenyl optionally substituted, B, D & E carbon, with A nitrogen, and  $R^3$  or  $R^4$  amino, with the other one lower alkoxy.

9. Another preferred form of the invention has  $X = NH$ ,  $n = 0$  or  $1$ , in which case  $R^1 = H$ , the aromatic ring phenyl optionally substituted, B, D & E carbon, with A nitrogen, and  $R^3$  or  $R^4$  lower mono or dialkylamino, with the other one lower alkoxy.

10. Another preferred form of the invention has  $X = NH$ ,  $n = 0$  or  $1$ , in which case  $R^1 = H$ , the aromatic ring phenyl optionally substituted, B, D & E carbon, with A nitrogen and  $R^3$  lower mono or dialkylamino, with  $R^4$  hydroxy.

Use of the 6-alkylquinaldic acid followed by ionic bromination under forcing conditions gives an anhydride, which is opened with ammonia, recycled to the imide, and then the Hoffman degradation occurs at the less active carbonyl. Cyclization and ring side chain addition in the normal manner is followed by a Stille coupling to introduce the R<sup>4</sup> alkyl group. At this step alkenyl or aryl substituents could also be introduced using this coupling technology.

7. Another preferred form of the invention has X = NH, n = 0 or 1, in which case R<sup>1</sup> = H, the aromatic ring phenyl optionally substituted, B, D & E carbon, with A nitrogen and R<sup>3</sup> and R<sup>4</sup> lower alkyl.

15 Scheme 5 - Route to Preferred Groups 8, 9, R<sup>3</sup> = OR

Dinitration of 2,6-dihydroxypyridine is followed by conversion to the very reactive dichloro compound. The dinitrodichloropyridine is singly displaced by cuprous cyanide in NMP, and then the compound is reduced under mild conditions to the diamine. The nitrile is hydrolysed to the amide, which can then be cyclized to the pyridopyrimidone, which is 4-chlorinated in the usual fashion. Displacement of the more reactive chlorine with the 4-sidechain is followed by displacement of the 6-chlorine with alkoxide. For group 9, the amine should be alkylated appropriately by methods familiar to one skilled in the art.

-29-

Scheme 6 - Route to Preferred Group 11

Compounds of preferred group 11 are specialized cases of preferred groups 6, 8, 9 and 10, where R<sup>3</sup> and R<sup>4</sup> are cyclized together. They can be made using the same routes as those described for the preferred groups, with minor modifications, which will be obvious to one skilled in the art. For example vicinally substituted alkoxy amino compounds can be dealkylated, and the corresponding vicinal aminoalcohols can be bisalkylated with an appropriate dihaloalkane.

11. Another preferred form of the invention has X = NH, n = 0 or 1, in which case R<sup>1</sup> = H, the aromatic ring phenyl optionally substituted, B, D & E carbon, with A nitrogen, and R<sup>3</sup> and R<sup>4</sup> taken together are dioxymethylene, dioxyethylene, 2,3-fused piperazine, 2,3-fused morpholine or 2,3-fused thiomorpholine.

Scheme 7 - Route for Preferred Groups 12-16

2,4-Diamino-5-cyanopyridine can be cyclized directly to many 4-benzylaminopyridopyrimidine derivatives by treatment with the benzylamine and formic acid at high temperature. For less nucleophilic amines 2,4-diamino-5-cyanopyridine is converted via ethyl orthoformate/acetic anhydride treatment, followed by cyclization with hydrosulfide ion in anhydrous conditions, to give 7-amino-4-thiono-3H-pyrido[4,3-d]pyrimidine. S-Alkylation and displacement with an appropriate amine gives the desired product. If R<sup>4</sup> is not amino, the amine can be

-30-

acylated, or reductively alkylated. Alternatively  
2,4-diamino-5-cyanopyridine can be hydrolysed to the  
corresponding amide, and this species can be cyclized  
to 7-amino-4-oxo-3H-pyrido[4,3-d]pyrimidine with  
5 orthoformate. Diazotization of the 7-amine and  
replacement with fluorine allows for introduction of  
other amine and alkoxide nucleophiles at the end of  
the synthesis after the C4 substituent has been  
introduced in the usual manner. Diazotization and  
10 replacement of the amine with bromide allows for  
Stille couplings at the 7-position.

12. Another preferred form of the invention  
has  $X = \text{NH}$ ,  $n = 0$  or  $1$ , in which case  $R^1 = \text{H}$ , the  
aromatic ring phenyl optionally substituted, A, D & E  
15 carbon, with B nitrogen and  $R^4$  lower alkoxy or  
halogen.

13. Another preferred form of the invention  
has  $X = \text{NH}$ ,  $n = 0$  or  $1$ , in which case  $R^1 = \text{H}$ , the  
aromatic ring phenyl optionally substituted, A, D & E  
20 carbon, with B nitrogen and  $R^4$  amino.

14. Another preferred form of the invention  
has  $X = \text{NH}$ ,  $n = 0$  or  $1$ , in which case  $R^1 = \text{H}$ , the  
aromatic ring phenyl optionally substituted, A, D & E  
carbon, with B nitrogen and  $R^4$  lower mono or  
25 dialkylamino.

15. Another preferred form of the invention  
has  $X = \text{NH}$ ,  $n = 0$  or  $1$ , in which case  $R^1 = \text{H}$ , the  
aromatic ring phenyl optionally substituted, A, D & E  
carbon, with B nitrogen and  $R^4$  hydrazino.

16. Another preferred form of the invention has  $X = NH$ ,  $n = 0$  or  $1$ , in which case  $R^1 = H$ , the aromatic ring phenyl optionally substituted, A, C & E carbon, with B nitrogen and  $R^4$  lower alkyl.

2-Chloro-5-nitropyridine is converted to the corresponding 2-fluorocompound by KF in DMSO. Reduction of the nitro group followed by treatment with Boc anhydride gives the Bocamino derivative, which can be metalated and carboxylated at the 4-position. Removal of the Boc with TFA and cyclization of the pyrimidone ring with formamide gives 6-fluoro-4-oxo-3H-pyrido[3,4-d]pyrimidine. This is 4-chlorinated in the usual manner and the 4-sidechain is introduced via displacement with an appropriate amine. Displacement of the 6-fluorine with appropriate nucleophiles leads to various different final products. If the fluorine is displaced by thiomethoxide, that in turn can be displaced by alkyl groups in Ni-catalyzed Grignard displacements.

17. Another preferred form of the invention has  $X = NH$ ,  $n = 0$  or  $1$ , in which case  $R^1 = H$ , the aromatic ring phenyl optionally substituted, A, B & E carbon, with D nitrogen and  $R^3$  lower alkoxy or halogen.

18. Another preferred form of the invention has  $X = NH$ ,  $n = 0$  or  $1$ , in which case  $R^1 = H$ , the aromatic ring phenyl optionally substituted, A, B & E carbon, with D nitrogen and  $R^3$  amino.

19. Another preferred form of the invention has  $X = NH$ ,  $n = 0$  or  $1$ , in which case  $R^1 = H$ , the aromatic ring phenyl optionally substituted, A, B & E carbon, with D nitrogen and  $R^3$  lower mono or dialkylamino.

20. Another preferred form of the invention has  $X = NH$ ,  $n = 0$  or  $1$ , in which case  $R^1 = H$ , the aromatic ring phenyl optionally substituted, A, B & E carbon, with D nitrogen and  $R^3$  hydrazino.

21. Another preferred form of the invention has  $X = NH$ ,  $n = 0$  or  $1$ , in which case  $R^1 = H$ , the aromatic ring phenyl optionally substituted, A, B & E carbon, with D nitrogen and  $R^3$  lower alkyl.

Scheme 9 - Route to Preferred Groups 22-26,  $R^1 = H$

Nitration of 2-methoxynicotinic acid is followed by displacement of the activated methoxy group and cyclization of the pyrimidone ring, possibly all in one step with formamidine, or alternatively in two steps with ammonia followed by cyclization with a formamide equivalent. The carbonyl is converted to the chloride and displaced with the sidechain in the usual fashion, and the nitro group is then selectively reduced to amino. This can be alkylated, acylated or diazotized. The diazo compound can be converted to hydroxy or to the bromide or iodide, and these latter can undergo a Stille coupling to introduce lower alkyl, alkenyl, aryl, etc. at  $R^3$ .

22. Another preferred form of the invention has  $X = NH$ ,  $n = 0$  or  $1$ , in which case  $R^1 = H$ , the

-33-

aromatic ring phenyl optionally substituted, A, B & D carbon, with E nitrogen and R<sup>3</sup> or R<sup>4</sup> H, with the other one lower alkoxy.

23. Another preferred form of the invention

25. Another preferred form of the invention  
15 has X = NH, n = 0 or 1, in which case R<sup>1</sup> = H, the aromatic ring phenyl optionally substituted, A, B & D carbon, with E nitrogen and R<sup>3</sup> or R<sup>4</sup> H, with the other one hydrazino.

26. Another preferred form of the invention  
20 has X = NH, n = 0 or 1, in which case R<sup>1</sup> = H, the aromatic ring phenyl optionally substituted, A, B & D carbon, with E nitrogen and R<sup>3</sup> or R<sup>4</sup> H, with the other one lower alkyl.

Scheme 10 - Route to Preferred Groups 22-26, R<sup>3</sup> = H

25 This route uses the known metalation and carboxylation of 2,6-difluoropyridine, followed by displacement of the 2-fluoro substituent. Cyclization of the pyrimidone ring with formamide, followed by

-34-

conversion of the carbonyl into chloride in a normal manner gives a chlorofluoropyridopyrimidine. The ar(alk)ylamino sidechain is introduced by displacement of the more reactive pyrimidine chlorine, and the R<sup>4</sup> substituent is then introduced by fluoride displacement. The introduction of alkyl utilizes displacement of F by alkoxide, later ether cleavage to the pyridone, O-triflation and Stille coupling.

**Scheme 11 -**  
**Route to Preferred Groups 27 and 29-31, R<sup>3</sup> = RO**

This scheme relies on the metalation of 2,6-difluoropyridine similarly to scheme 10. The first metalation is used to introduce oxygen, and the second to introduce the carboxylic acid. If required to force the second metalation to the 5-position the oxygen may be protected as the very bulky TIPS ether, and stronger bases than LDA may be required. Ammonia is introduced at the 2-position under high temperature and pressure, and the pyridone ring is cyclized, and activated at the 4-position in the usual manner and then displaced with the 4-position sidechain. Displacement of the 7-fluoro substituent with an appropriate nucleophile, followed by conversions as described in previous schemes finishes the synthesis.

27. Another preferred form of the invention has X = NH, n = 0 or 1, in which case R<sup>1</sup> = H, the aromatic ring phenyl optionally substituted, A, B & D carbon, with E nitrogen and R<sup>3</sup> and R<sup>4</sup> lower alkoxy.

carbon, with E nitrogen, and R<sup>3</sup> or R<sup>4</sup> amino, with the other one lower alkoxy.

30. Another preferred form of the invention has X = NH, n = 0 or 1, in which case R<sup>1</sup> = H, the aromatic ring phenyl optionally substituted, A, B & D carbon, with E nitrogen, and R<sup>3</sup> or R<sup>4</sup> lower mono or dialkylamino, with the other one lower alkoxy.

31. Another preferred form of the invention has X = NH, n = 0 or 1, in which case R<sup>1</sup> = H, the aromatic ring phenyl optionally substituted, A, B & D carbon, with E nitrogen and R<sup>4</sup> lower mono or dialkylamino, with R<sup>3</sup> hydroxy.

**Scheme 12 - Route to Preferred Group 28**

5-Bromo-2,6-difluoronicotinic acid is prepared from 2,6-difluoropyridine by successive lithiations using LDA. The 5-position is alkylated via a Stille coupling, and the pyrimidone ring is cyclized on in two steps. The 4-substituent is introduced in the usual fashion and the 7-fluoro group is displaced with thiomethoxide. This thioether in turn is displaced by a Grignard agent in the presence of a nickel salt catalyst. Again use of appropriate organometallic reagents in the Stille and Grignard couplings could lead to alkenyl, alkynyl and aryl substituents at R<sup>3</sup> and R<sup>4</sup>.

28. Another preferred form of the invention has X = NH, n = 0 or 1, in which case R<sup>1</sup> = H, the aromatic ring phenyl optionally substituted, A, B & D carbon, with E nitrogen and R<sup>3</sup> and R<sup>4</sup> lower alkyl.

Scheme 13 - Route to Preferred Groups 29 and 30,  $R^4 = RO$

Nitration of the commercially available dichloronicotinic acid is followed by a selective displacement of the more reactive Cl under mild conditions, followed by a more forcing displacement of the other Cl, in the appropriate order. The resulting 6-alkoxy-2-amino-5-nitronicotinic acid is cyclized to the pyrimidone, and the 4-carbonyl is converted to a chloride and displaced in the usual fashion with an appropriate amine to give the 4-amino-7-alkoxy-6-nitropyrido[2,3-d]pyrimidine. Reduction of the nitro group, followed by any desired alkylation or acylation gives the desired compounds.

Scheme 14 - Route to Preferred Group 32

Compounds of group 32 are specialized cases of preferred groups 27, 29, 30 and 31, where  $R^3$  and  $R^4$  are cyclized together. They can be made using the same routes as those described for these preferred groups with minor modifications. For example, vicinally substituted alkoxy amino compounds can be dealkylated, and the corresponding vicinal amino alcohols can be bisalkylated with an appropriate dihaloalkane. Piperazines can be made by the route shown in Scheme 13, provided that a suitable amine nucleophile is used to displace the 6-chloro substituent instead of an alkoxide.

32. Another preferred form of the invention has  $X = NH$ ,  $n = 0$  or  $1$ , in which case  $R^1 = H$ , the aromatic ring phenyl optionally substituted, A, B & D carbon, with E nitrogen, and  $R^3$  and  $R^4$  taken together are dioxymethylene, dioxyethylene, 2,3-fused

5           Reaction of a suitable S-alkylisothiuronium  
salt with methoxymethylidene malononitrile yields a  
fully functionalized pyrimide precursor. The  
initially formed pyrimidine can have the SEt displaced  
by R<sup>4</sup> either before or after the nitrile hydrolysis, if  
displacement or oxidation prove problematic later.  
10       Displacement of the SEt group can also be achieved  
without an oxidation to activate the sulfur.

The [3,2-d] ring fusion compounds are obtained from 3-bromofurfural as shown above in Scheme A. Displacement of the bromide by azide, followed by oxidation of the aldehyde sets up the basic aminofuroic acid needed to fuse on the pyrimidine ring. The annulation shown can be used, or by manipulating which acid derivative is actually used, one could use a variety of other ring annulations, and subsequent activations of the 4-position if required.

25    **Biology**

These compounds are potent and selective inhibitors of the human EGF receptor tyrosine kinase,

-52-

and other members of the EGF receptor family, including the ERB-B2, ERB-B3 and ERB-B4 receptor kinases, and are useful for the treatment of proliferative diseases in mammals. These inhibitors prevent mitogenesis in cells where mitogenesis is driven by one or more of this family of receptor kinases. This can include normal cells, where it is desired to prevent mitogenesis, as exemplified by the cells transformed by overexpression or mutation of this kinase family as exemplified by poor prognosis breast cancer where overexpression of EGFR, ERB-B2 and ERB-B3 or mutation of ERB-B2 to the oncoprotein NEU is a major factor in cellular transformation. As the preferred compounds are not highly cytotoxic and do not show potent growth inhibitory properties, because of their high specificity toward inhibition of the EGFR kinase family, they should have a much cleaner toxicity profile than most anti-cancer and anti-proliferative drugs. Their very different mode of action to current anti-cancer drugs should allow for their use in multiple drug therapies, where synergism with available agents is anticipated.

Compounds of the invention have been shown to be very potent, reversible inhibitors of the EGF receptor tyrosine kinase, by binding with high affinity at the adenosine triphosphate (ATP) binding site of the kinase. These compounds exhibit potent  $IC_{50}$ s, varying from 10 micromolar to 5 picomolar, for the tyrosine kinase activity of the enzyme, based on an assay examining phosphorylation of a peptide derived from the phosphorylation site of the protein PLCgamma1, a known EGFR phosphorylation substrate. This data is shown in Table 1.

## Biological Data

### Materials and Methods

#### *Purification of Epidermal Growth Factor*

Receptor Tyrosine Kinase - Human EGF receptor tyrosine kinase was isolated from A431 human epidermoid carcinoma cells which overexpress EGF receptor by the following methods. Cells were grown in roller bottles in 50% Delbuco's Modified Eagle and 50% HAM F-12 nutrient media (Gibco) containing 10% fetal calf serum. Approximately  $10^9$  cells were lysed in two volumes of buffer containing 20 mM 2-(4N-[2-hydroxyethyl]piperazin-1-yl)ethanesulfonic acid (hepes), pH 7.4, 5 mM ethylene glycol bis(2-aminoethyl ether) N,N,N',N'-tetraacetic acid, 1% Triton X-100, 10% glycerol, 0.1 mM sodium orthovanadate, 5 mM sodium fluoride, 4 mM pyrophosphate, 4 mM benzamide, 1 mM dithiothreitol, 80  $\mu$ g/mL aprotinin, 40  $\mu$ g/mL leupeptin and 1 mM phenylmethylsulfonyl fluoride. After centrifugation at 25,000 x g for 10 minutes, the supernatant was equilibrated for 2 h at 4°C with 10 mL of wheat germ agglutinin sepharose that was previously equilibrated with 50 mM Hepes, 10% glycerol, 0.1% Triton X-100 and 150 mM NaCl, pH 7.5, (equilibration buffer). Contaminating proteins were washed from the resin with 1 M NaCl in equilibration buffer, and the enzyme was eluted with 0.5 M N-acetyl-1-D-glucosamine in equilibration buffer, followed by 1 mM urea. The enzyme was eluted with 0.1 mg/ml EGF. The receptor appeared to be homogeneous as assessed by Coomassie blue stained polyacrylamide electrophoretic gels.

**Cells**

Swiss 3T3 mouse fibroblasts, A431 human epidermoid carcinoma cells, and MCF-7 (Michigan Cancer Foundation human mammary carcinoma cells), SK-BR-3 (human mammary carcinoma cells), MDA-MB-231 and MDA-MB-468 (human mammary carcinoma cells) breast

-58-

carcinomas were obtained from the American Type Culture Collection, Rockville, Maryland and maintained as monolayers in dMEM (Dulbecco's modified eagle medium)/F12, 50:50 (Gibco/BRL) containing 10% fetal bovine serum. To obtain conditioned medium, MDA-MB-231 cells were grown to confluency in an 850 cm<sup>2</sup> roller bottle and the medium replaced with 50 ml of serum-free medium. After 3 days the conditioned medium was removed, frozen down in aliquots and used as a heregulin source to stimulate erbB-2, 3, 4.

### Antibodies

Monoclonal antibodies raised to the PDGF (platelet-derived growth factor) receptor or phosphotyrosine were from Upstate Biotechnology, Inc., Lake Placid, NY. Anti-pp39<sup>jun</sup> (antibody to the transcription factor c-jun, which is a 39 kDalton phosphoprotein) and anti-EGF receptor antibodies were from Oncogene Science, Uniondale, NY.

### Immunoprecipitation and Western Blot

Cells were grown to 100% confluency in 100 mm Petrie dishes (Corning). After the cells were treated for 5 minutes with either EGF (epidermal growth factor), PDGF, or bFGF (basic fibroblast growth factor) (20 ng/ml) or 1 ml of conditioned media from MDA-MB-231 cells, the media was removed and the monolayer scraped into 1 ml of ice cold lysis buffer (50 mM Hepes, pH 7.5, 150 mM NaCl, 10% glycerol, 1% triton X-100, 1 mM EDTA, 1 mM EGTA, 10 mM sodium pyrophosphate, 30 mM p-nitrophenyl phosphate, 1 mM orthovanadate, 50 mM sodium fluoride, 1 mM

-59-

phenylmethylsulfonylfluoride, 10  $\mu$ g/ml of aprotinin, and 10  $\mu$ g/ml of leupeptin). The lysate was transferred to a microfuge tube (small centrifuge that holds 1-2 ml plastic centrifuge tubes), allowed to sit on ice 15 minutes and centrifuged 5 minutes at 10,000 x g. The supernatant was transferred to a clean microfuge tube and 5  $\mu$ g of antibody was added to designated samples. The tubes were rotated for 2 hours at 4° C after which 25  $\mu$ l of protein A sepharose was added and then rotation continued for at least 2 more hours. The protein A sepharose was washed 5 times with 50 mM Hepes, pH 7.5, 150 mM NaCl, 10% glycerol and 0.02% sodium azide. The precipitates were resuspended with 30  $\mu$ l of Laemlli buffer (Laemmli, NATURE, Vol. 727, pp. 680-685, 1970), heated to 100°C for 5 minutes and centrifuged to obtain the supernatant. Whole cell extracts were made by scraping cells grown in the wells of 6 well plates into 0.2 ml of boiling Laemmli buffer. The extract were transferred to a microfuge tube and heated to 100° C for 5 minutes. The entire supernatant from the immunoprecipitation or 35  $\mu$ l of the whole cell extract was loaded onto a polyacrylamide gel (4-20%) and electrophoresis carried out by the method of Laemlli (Laemmli, 1970). Proteins in the gel were electrophoretically transferred to nitrocellulose and the membrane was washed once in 10 mM Tris buffer, pH 7.2, 150 mM NaCl, 0.01% Azide (TNA) and blocked overnight in TNA containing 5% bovine serum albumin and 1% ovalbumin (blocking buffer). The membrane was blotted for 2 hours with the primary antibody (1 $\mu$ g/ml in blocking buffer) and then washed 2 times sequentially in TNA, TNA containing 0.05% Tween-20 and 0.05% Nonidet P-40 (commercially available detergent) and TNA. The membranes were then incubated for 2 hours in blocking buffer containing 0.1  $\mu$ Ci/ml of [<sup>125</sup>I] protein A and then washed again as above.

-60-

After the blots were dry they were loaded into a film cassette and exposed to X-AR X-ray film for 1-7 days. Protein A is a bacterial protein that specifically bonds certain IgG subtypes and is useful in binding to  
5 and isolating antibody-antigen complexes.

#### Northern Blots

Total cellular RNA was isolated from untreated control or treated Swiss 3T3 cells using RNAzol-B (trademark of Tel Test Inc. for a kit used to  
10 isolate RNA from tissues) and adhered to the protocol described by the manufacturer. Forty to fifty  $\mu$ g of RNA was loaded onto a 1% agarose gel and electrophoresis carried out for 3-4 hours at 65 volts. The RNA in the gel was transferred by capillary action  
15 to a nylon membrane (Hybond-N, Amersham). The 40 mer c-jun probe was end labeled with [ $^{32}$ P]ATP using T4 nucleotide kinase (Promega) and purified on a G25 sephadex column according to the procedure recommended by the supplier, Oncogene Science. Hybridization was  
20 performed overnight at 65°C (c-jun is an immediate early transcription factor; it is one of the components of AP-1 while FOS is the second component of AP-1.

#### Growth Factor-Mediated Mitogenesis

25 Swiss 3T3 fibroblasts were grown to 90 - 100% confluency in 24- well plates (1.7 x 1.6 cm, flat bottom) and growth arrested in serum-free media for 18 hours. Drug was added to specified wells 2 hours prior to growth factors and then the cells were exposed to  
30 either 20 ng/ml EGF, PDGF or bFGF or 10% serum for 24

-61-

hours. Two  $\mu\text{Ci}$  of [methyl- $^3\text{H}$ ]thymidine was added to each well and incubated for 2 hours at  $37^\circ\text{C}$ . The cells were trypsinized and injected into 2 ml of ice cold 15% trichloroacetic acid (TCA). The resulting precipitate was collected on glassfiber filters, washed five times with 2-ml aliquots of ice-cold 15% TCA, dried and placed in scintillation vials along with 10 ml Ready gel (Beckman, Irvine, CA). Radioactivity was determined in a Beckman LS 6800 scintillation counter.

#### Growth Inhibition Assay

Cells ( $2 \times 10^4$ ) were seeded in 24-well plates (1.7 x 1.6 cm, flat bottom) in two mls of medium with or without various concentrations of drug. Plates were incubated for 3 days at  $37^\circ$  in a humidified atmosphere containing 5%  $\text{CO}_2$  in air. Cell growth was determined by cell count with a Coulter Model AM electronic cell counter (Coulter Electronics, Inc., Hialeah, FL).

15 The above gels, developed as detailed in the  
experimental section, demonstrate the efficacy of  
compounds of the current invention at blocking certain  
EGF-stimulated mitogenic signalling events in whole  
cells. The numbers to the left of the gels indicated  
the positions of molecular weight standards in  
20 kiloDaltons. The lane labelled control shows the  
degree of expression of the growth-related signal in  
the absence of EGF stimulation, whereas the lane  
labelled EGF (or PDGF or b-FGF) shows the magnitude of  
the growth factor-stimulated signal. The other lanes  
25 show the effect of the stated quantities of the named  
drug on the growth factor-stimulated activity being

measured, demonstrating that the compounds of the present invention have potent effects in whole cells, consistent with their ability to inhibit the tyrosine kinase activity of the EGF receptor.

5                   Gel of Example 40 (Fig. 7) detects mRNA for c-jun by hybridization with a specific radiolabelled RNA probe for c-jun. The gel demonstrates that the growth factors EGF, PDGF and b-FGF stimulate c-jun  
10 blocks this production for EGF-stimulated cells, but not for PDGF or b-FGF stimulated cells.

                  It is to be appreciated that the compounds described herein can be used in combination with other components to enhance their activity. Such additional components are anti-neoplastic materials as,  
25 doxorubicin, taxol, cis platin, and the like.

                  It has been found that the compounds described herein may inhibit both the erb-B2 and erb-B4 receptors and therefore have significantly increased clinical activity advantageously in

combination with the aforementioned anti-neoplastic agents.

Example 14-Anilinopyrido[3,2-d]pyrimidine mesylate

3H-Pyrido[3,2-d]pyrimidin-4-one. A solution of 6-chloro-3-nitropicolinamide (2.00 g, 9.91 mmol) in EtOAc/MeOH (1:1, 100 mL) is hydrogenated over 5% Pd-C (0.40 g) at 60 psi for 6 days, with additions of fresh catalyst after 2 and 4 days. After removal of the catalyst by filtration the solution is concentrated to dryness, to give 3-aminopicolinamide as an orange oil, which is used directly in the next step. The crude product is stirred under reflux with triethyl orthoformate (50 mL) for 42 h, during which time a tan precipitate forms. After cooling, the solid is filtered off, washed well with petroleum ether, and dried under vacuum to give 3H-pyrido[3,2-d]pyrimidin-4-one (1.27g, 87%), mp 343-345 °C [Price, C.C. and Curtin, D.Y. J. Amer. Chem. Soc. 68, 914, 1946 report mp 346-347 °C].

A suspension of the above pyrimidinone (1.00 g, 6.80 mmol) in POCl<sub>3</sub> (30 mL) is heated under reflux for 4 h, and then concentrated to dryness under reduced pressure. The residue is partitioned between CH<sub>2</sub>Cl<sub>2</sub> and saturated NaHCO<sub>3</sub> solution, and the organic layer worked up to give 4-chloropyrido[3,2-d]pyrimidine (0.97 g, 86%) as a tan solid, mp 335 °C (dec), which is used without further characterisation.

4-Anilinopyrido[3,2-d]pyrimidine mesylate.

The pharmaceutical compositions of the invention can take any of a wide variety of oral and parenteral dosage forms. The dosage forms comprise as the active components an inhibitor as defined previously.

For preparing pharmaceutical compositions, one uses inert, pharmaceutically acceptable carriers

-126-

that can be either solid or liquid. Solid form preparations include powders, tablets, dispersible granules, capsules, cachets, and suppositories. A solid carrier can be one or more substances which may also act as dilutents, flavoring agents, solubilizers, lubricants, suspending agents, binders, or tablet disintegrating agents; it can also be an encapsulating material. In powders, the carrier is a finely divided solid which is in admixture with the finely divided active compounds. In the tablet, the active compounds are mixed with carrier having the necessary binding properties in suitable proportions and compacted in the shape and size desired. The powders and tablets preferably contain from 5% or 10% to about 70% of active ingredients. Suitable solid carriers are magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, tragacanth, methyl cellulose, sodium carboxymethyl cellulose, a low melting wax, cocoa butter, and the like. The term "preparation" is intended to include the formulation of the active compounds with encapsulating materials as carrier, providing a capsule in which the active components (with or without other carriers) are surrounded by carrier, which are thus in association with it. Similarly, cachets are included. Tablets, powders, cachets, and capsules can be used as solid dosage forms suitable for oral administration.

Liquid form preparations include solutions, suspensions, and emulsions. As an example may be mentioned water or water-propylene glycol solutions for parenteral injection. Liquid preparations can also be formulated in solution in aqueous polyethylene glycol solution. Aqueous solutions suitable for oral

-127-

use can be prepared by dissolving the active component in water and adding suitable colorants, flavors, stabilizing, and thickening agents as desired.

5 Aqueous suspensions suitable for oral use can be made by dispersing the finely divided active components in water with viscous material, i.e., natural or synthetic gums, resins, methyl cellulose, sodium carboxymethyl cellulose, and other well-known suspending agents.

10 Preferably, the pharmaceutical preparation is in unit dosage form. In such form, the preparation may be subdivided into unit doses containing appropriate quantities of inhibitor and other anti-cancer materials individually or as a combination,  
15 i.e., in a mixture. The unit dosage form can be a packaged preparation, the package containing discrete quantities of preparation, for example, packeted tablets, capsules, and powders in vials or ampoules. The unit dosage form can also be a capsule, cachet, or  
20 tablet itself or it can be the appropriate number of any of these in packaged form. Additionally, the unit dosage form may be a dividable form having an inhibitor in one part and other anti-cancer materials in the other part, such as, a dividable capsule, a  
25 dividable package, or a two-part ampoule, vial or the like.

The quantity of an inhibitor in unit dosages of preparation may be varied or adjusted from about 0.01 mg/kg to 100.0 mg/kg, preferably 0.03 mg/kg to  
30 less than 1.0 mg/kg of inhibitor.

-128-

The pharmaceutical compositions preferably are constituted so that they can be administered parenterally or orally. Solutions of the active compounds as free bases and free acids or  
5 pharmaceutically acceptable salts can be prepared in water suitable mixed with a surfactant such as hydroxypropylcellulose. Dispersions can also be prepared in glycerol, liquid polyethylene glycols, and mixtures thereof and in oils. Under ordinary  
10 conditions of storage and use, these preparations contain a preservative to prevent the growth of microorganisms.

The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or  
15 dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions or dispersions. In all cases, the form must be sterile and must be fluid to the extent that easy syringability exists. It must be stable under the  
20 conditions of manufacture and storage and must be preserved against the contaminating action of the microorganisms such as bacteria and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol, polyol (for  
25 example, glycerol, propylene glycol, and liquid polyethylene glycol, and the like), suitable mixtures thereof, and vegetable oils. The proper fluidity can be maintained, for example, by the use of a coating such as lecithin, by the maintenance of the required  
30 particle size in the case of dispersion, and by the use of surfactants. The prevention of the action of microorganisms can be brought about by various antibacterial and antifungal agents, for example,

-129-

paragens, chlorobutanol, phenol, sorbic acid, thimerosal, and the like. In many cases, it will be preferred to include isotonic agents, for example, sugars or sodium chloride. Prolonged absorption of the injectable compositions of agents delaying absorption, for example, gelatin.

Sterile injectable solutions are prepared by incorporating the active compounds in the required amount in the appropriate solvent with various other ingredients enumerated above, as required, followed by filtered sterilization. Generally, dispersions are prepared by incorporating the various sterilized active ingredients, into a sterile vehicle which contains the basic dispersion medium and the required other ingredients from those enumerated above. In the case of the sterile powders for the preparation of sterile injectable solutions, the preferred methods of preparation are vacuum drying and the freeze-drying technique which yields a powder of active ingredients plus an additional desired ingredient from a previously sterile-filtered solution thereof.

As used herein, "pharmaceutically acceptable carrier" includes any and all solvents, dispersion media, coatings, antibacterial and antifungal agents, isotonic and absorption delaying agents and the like. The use of such media and agents for pharmaceutically active substances is well known in the art. Except insofar as any conventional media or agent is incompatible with the active ingredient, its use in the therapeutic compositions is contemplated. Supplementary active ingredients can also be incorporated into the compositions.

-130-

It is especially advantageous to formulate parenteral compositions in dosage unit form for ease of administration and uniformity of dosage. Dosage unit form as used herein refers to physically discrete units suitable as unitary dosages for the mammalian subjects to be treated; each unit containing a predetermined quantity of active materials calculated to produce the desired therapeutic effect in association with the required pharmaceutical carrier. The specification for the novel dosage unit forms of the invention are dictated by and directly dependent on (a) the unique characteristics of the active materials and the particular therapeutic effect to be achieved, and (b) the limitation inherent in the art of compounding such active materials for the treatment of disease in living subjects having a diseased condition in which bodily health is impaired as herein disclosed in detail.

The principal active ingredients are compounded for convenient and effective administration in effective amounts with a suitable pharmaceutically acceptable carrier in dosage unit form as hereinbefore disclosed. A unit parenteral dosage form can, for example, contain the principal active compound, i.e. an inhibitor, in amounts ranging from about 0.5 to about 100 mg, with from about 0.1 to 50 mg being preferred. The daily parenteral doses for mammalian subjects to be treated ranges from 0.01 mg/kg to 10 mg/kg of the inhibitor. The preferred daily dosage range is 0.1 mg/kg to 1.0 mg/kg.

For oral dosages, the daily amount may range from 0.01 mg of active compound/kg of mammalian

-131-

subject to 100 mg/kg, preferably 0.1 to 10 mg/kg of subject.

The inhibitor described above may form commonly known, pharmaceutically acceptable salts such as alkali metal and other common basic salts or acid addition salts, etc. References to the base substances are therefore intended to include those common salts known to be substantially equivalent to the parent compound and hydrates thereof.

The active compounds described herein are capable of further forming both pharmaceutically acceptable acid addition and/or base salts. All of these forms are within the scope of the present invention.

Pharmaceutically acceptable acid addition salts of the active compounds include salts derived from nontoxic inorganic acids such as hydrochloric, nitric, phosphoric, sulfuric, hydrobromic, hydriodic, hydrofluoric, phosphorous, and the like, as well as the salts derived from nontoxic organic acids, such as aliphatic mono- and dicarboxylic acids, phenyl-substituted alkanoic acids, hydroxy alkanoic acids, alkanedioic acids, aromatic acids, aliphatic and aromatic sulfonic acids, etc. Such salts thus include sulfate, pyrosulfate, bisulfate, sulfite, bisulfite, nitrate, phosphate, monohydrogenphosphate, dihydrogenphosphate, metaphosphate, pyrophosphate, chloride, bromide, iodide, acetate, trifluoroacetate, propionate, caprylate, isobutyrate, oxalate, malonate, succinate, suberate, sebacate, fumarate, maleate, mandelate, benzoate, chlorobenzoate, methylbenzoate,

-132-

dinitrobenzoate, phthalate, benzenesulfonate, toluenesulfonate, phenylacetate, citrate, lactate, maleate, tartrate, methanesulfonate, and the like. Also contemplated are salts of amino acids such as arginate and the like and gluconate, galacturonate (see, for example, Berge, S.M. et al, "Pharmaceutical Salts", JOURNAL OF PHARMACEUTICAL SCIENCE, 66, pp. 1-19 (1977)).

The acid addition salts of said basic compounds are prepared by contacting the free base form with a sufficient amount of the desired acid to produce the salt in the conventional manner. Preferably, an active compound can be converted to an acidic salt by treating with an aqueous solution of the desired acid, such that the resulting pH is less than 4. The solution can be passed through a C18 cartridge to absorb the compound, washed with copious amounts of water, the compound eluted with a polar organic solvent such as, for example, methanol, acetonitrile, and the like, and isolated by concentrating under reduced pressure followed by lyophilization. The free base form may be regenerated by contacting the salt form with a base and isolating the free base in the conventional manner. The free base forms differ from their respective salt forms somewhat in certain physical properties such as solubility in polar solvents, but otherwise the salts are equivalent to their respective free base for purposes of the present invention.

Pharmaceutically acceptable base addition salts are formed with metals or amines, such as alkali and alkaline earth metals or organic amines. Examples

-133-

of metals used as cations are sodium, potassium, magnesium, calcium, and the like. Examples of suitable amines are N,N'-dibenzylethylenediamine, chloroprocaine, choline, diethanolamine, dicyclohexylamine, ethylenediamine, N-methylglucamine, and procaine (see, for example, Berge, S.M. et al, "Pharmaceutical Salts", JOURNAL OF PHARMACEUTICAL SCIENCE, 66, pp. 1-19 (1977)).

The base addition salts of said acidic compounds are prepared by contacting the free acid form with a sufficient amount of the desired base to produce the salt in the conventional manner. Preferably, an active compound can be converted to a base salt by treating with an aqueous solution of the desired base, such that the resulting pH is greater than 9. The solution can be passed through a C18 cartridge to absorb the compound, washed with copious amounts of water, the compound eluted with a polar organic solvent such as, for example, methanol, acetonitrile and the like, and isolated by concentrating under reduced pressure followed by lyophilization. The free acid form may be regenerated by contacting the salt form with an acid and isolating the free acid in the conventional manner. The free acid forms differ from their respective salt forms somewhat in certain physical properties such as solubility in polar solvents, but otherwise the salts are equivalent to their respective free acids for purposes of the present invention.

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 95/00941

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
Although claims 1-70,73,75-78,80,81 are directed to a method of treatment of (diagnostic method practised on) the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
~~because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:~~  
Furthermore claims 76-81 have only been searched as far as the activity of the compounds has been described related to epidermal growth factor receptor tyrosine Kinase inhibition.
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
